Sprint retrospective

EcoCharge prototype review and improvements

Our prototype managed to keep our scope small enough by dividing the display of the fleet, the calculator functionality, and the styles into separate files. Our repository consists of ten vehicle entries, local images credited accordingly, documentation of planning, and an information security memo. Tests have been written that have both valid and invalid input.

However, the repository review also identified problems with integration. For instance, the test file is located in the root directory of the project even though the import requires the tests directory. The README needs to include directions on how to run the application and tests.

For next time, we should decide on the folder structure before uploading files, and then always do testing from a new download after merging using feature branches. We should also keep the documentation up-to-date with our code and finally have a checklist to follow. This will enable us to identify packaging issues early on and ensure a smoother transfer in the end.
